iPaaS UI Style Guide

1. Routing	2
------------------	---

Chapter 1. Routing

URLs should be consistent, short, canonical and easy to remember, while also being extensible. It can be common to have multiple views or operations for a single entity or a collection of entities.

As an example, here are some examples for routes relating to the entity 'Connection':

- `/connections` view all connections and search using query parameters
- `/connections/:id` view connection given an id
- `/connections/:id/edit` edit connection given an id
- `/connections/new` create new connection
- `/connections/install` custom views for collections of connections such as installing new connections
