iPaaS UI Style Guide

Chapter 1. Routing

URLs should be consistent, short, canonical and easy to remember, while also being extensible. It can be common to have multiple views or operations for a single entity or a collection of entities.

As an example, here are some examples for routes relating to the entity 'Connection':

- `/connections` view all connections and search using query parameters
- `/connections/:id` view connection given an id
- `/connections/:id/edit` edit connection given an id
- `/connections/new` create new connection
- `/connections/install` custom views for collections of connections such as installing new connections
